Dear Distinguished Trustees of the Nolan Broom Corn Trust,

The following reports on the activities at the University of Illinois since our last report in November, 2013. I include the results from our 2013 broomcorn evaluations that were analyzed in spring 2014, which were then used to make selections for entries in the 2014 evaluation and seed increase. Jessica Bubert, my graduate student, led all of the broomcorn efforts as one component of her Ph.D. research in plant breeding.

1. Re-establish broomcorn collection at Illinois. Among the original 46 broomcorn accessions that were grown at Illinois in 2013, we obtained hand-pollinated seed from one or more plants for 43. All 43 accessions were planted on May 27 and additional seed increases made by controlled self-pollination of individual plants. The full list of broomcorn plots is included as Appendix A following this report. Accessions designated as "IL_number" are those previously deposited to the USDA GRIN germplasm bank by Don White. The collection also includes Deer, Acme, and Black Spanish broomcorn varieties, as well as the populations "Main Gene Pool Mix" and "Hadley Ornamental" from Sam Moyer.

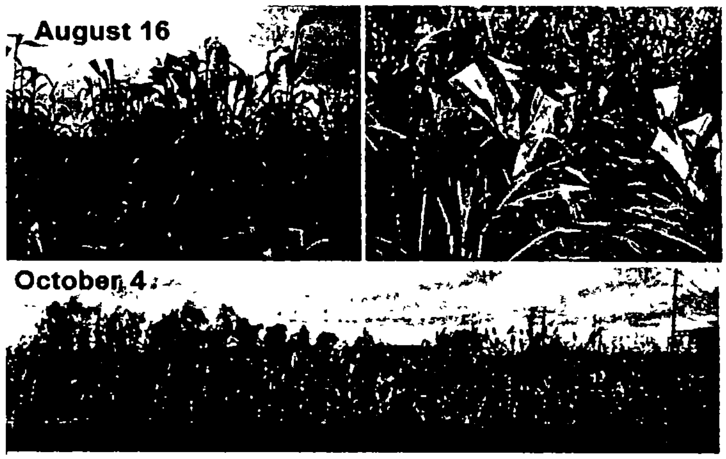

Figure 1: Pictures of 2014 Illinois broomcorn nursery.

2. Conduct selections for desirable broomcorn traits. Each panicle from all plants grown in 2013 was evaluated for traits that relate to features of desirable broomcorns, as illustrated to me and Jessica Bubert by Tim Monahan during his fall 2013 visit to our plots. A desirable broomcorn will have long panicle branches with seeds concentrated at the end, and no fusion of central branches. Accordingly, we measured total seed yield (weight in grams) and the lengths in inches for the total panicle from peduncle to tip, the length of the region with seeds, and the

telephone 217-244-6308 • *fax* 217-333-4582
email smoose@illinois.edu • *url* http //cropsci illinois edu/faculty/moose/

length of the regions without seeds. We also used a binary scoring for the degree of fusion of central branches, a value of 1 if one-fourth or more of the total panicle length had fused branches, and a value of 0 if less than one-fourth. We then calculated a "broomscore" where the total length of the panicle was divided by the ratio of the seed and non-seed portions of the panicle. Representative photographs for each accession were also taken to document traits, a set of photos from some of the best and worst broomscore accessions are included in Figure 2. All of the data is included as Appendix B at the end of the report.

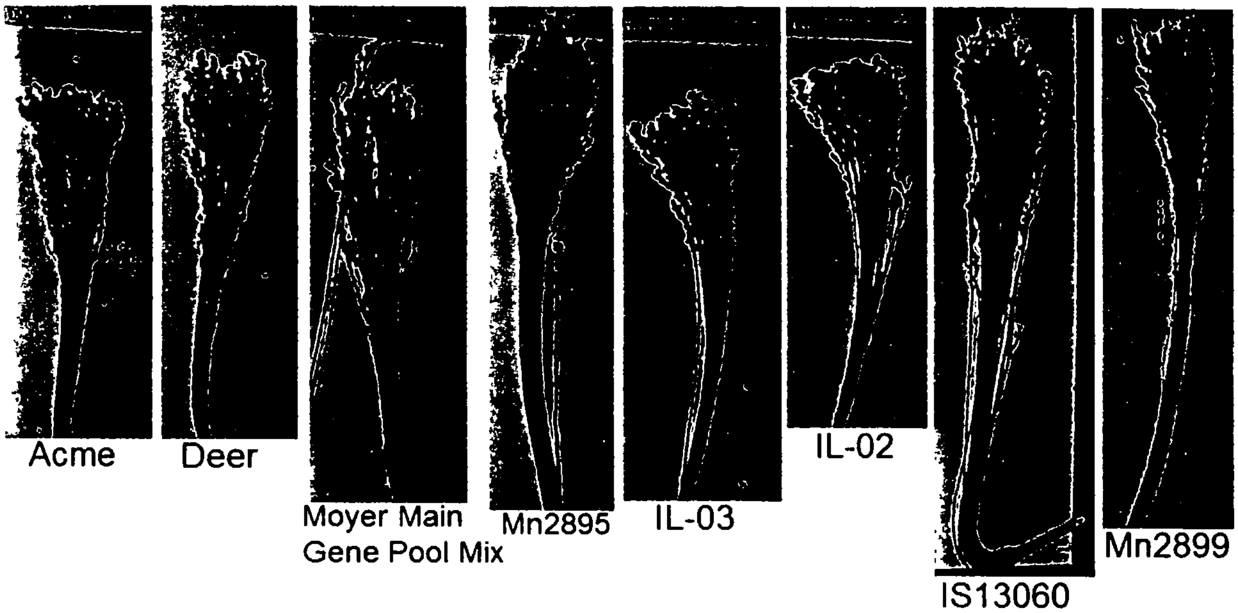

Figure 2: Variation in broom traits among 2013 accessions. The three varieties at left are historically popular broomcorns, the five to the right are the top selections based on highest broomscore and low ratings for fused central branches.

The most desirable brooms would have higher broom scores due to longer length, and small portion of the broom containing seeds at the tip. It is also valuable for plant height to be in a range that facilitates hand harvest (broom between shoulder and head height), with shorter plants also being less likely to exhibit lodging. Plant height was included as a measure in 2014.

3. Genetic analysis of broomcorns. We obtained high-density genetic profiles for each of the broomcorn accessions planted in 2013. The data analysis is ongoing, with the first two goals being to assess the genetic relationships of broomcorn accessions to the global collection of sorghum germplasm, and to test for regions of the sorghum genome that are associated with broomcorn traits. To help further define gene-trait associations for broomcorn, it is necessary to produce populations derived from crosses between broomcorn and conventional grain sorghum types, which will then show variation for "broominess" the genes that control such traits. We initiated such populations in 2014 by crossing desirable broomcorn types to the male sterile BTx623 grain sorghum inbred. Seed was successfully generated from crosses of the ten highest broomscore lines.

4. Planned Activities for 2015.

a. Complete analysis of the genetic data for broomcorn relationships to other sorghums and tests of associations with favorable broomcorn traits.

b. Analyze the trait data collected from the 2014 field season, and combine this with the 2013 observations to determine heritability and stability of broomcorn traits.

c. Plant a broomcorn genetic nursery to increase seed of the Deer variety and some of the top broomscore accessions for future larger-scale plantings, conduct further evaluation and selection of improved broomcorn lines, and self-pollinate the hybrids between high broomscore lines and BTx623.

Any questions or discussion regarding the above plans is welcomed.

Respectfully submitted,

Stephen Moose

I continue to develop several broomcorn varieties of different colors and brush lengths Of special interest is one of potential commercial use from crosses of two of Dr Hadley's green varieties

Completed an experiment to learn if a tetraploid dwarf grain sorghum created by Dr Hadley could produce a much seed weight as a tall grain sorghum variety It didn't

There has been no financial support for this research, a labor of love
